

Pessimistic Query Optimization: Tighter Upper Bounds for Intermediate Join Cardinalities

Walter Cai Magdalena Balazinska Dan Suciu

University of Washington

[walter,magda,suciu]@cs.washington.edu

April 23, 2019

Contributions

- ▶ Technique for tightening theoretically guaranteed join cardinality upper bounds.

Contributions

- ▶ Technique for tightening theoretically guaranteed join cardinality upper bounds.
- ▶ Method for enumerating practical subset of bounding formulas.

Contributions

- ▶ Technique for tightening theoretically guaranteed join cardinality upper bounds.
- ▶ Method for enumerating practical subset of bounding formulas.
- ▶ Partition budgeting strategy to control the space complexity of our sketches, and the time complexity of our bound calculation.

Contributions

- ▶ Technique for tightening theoretically guaranteed join cardinality upper bounds.
- ▶ Method for enumerating practical subset of bounding formulas.
- ▶ Partition budgeting strategy to control the space complexity of our sketches, and the time complexity of our bound calculation.
- ▶ Demonstrate practicality on challenging real world benchmark.

- 7 Conclusion and Future Directions

Query Optimization

- ▶ Accepts queries.
- ▶ Picks “best” physical plan.
 - ▶ Could be millions of correct physical plans!
 - ▶ Conceptually, a tree with leaves as base relations.

Query Optimization

- ▶ Accepts queries.
- ▶ Picks “best” physical plan.
 - ▶ Could be millions of correct physical plans!

Query Optimization

- ▶ Accepts queries.
- ▶ Picks “best” physical plan.
 - ▶ Could be millions of correct physical plans!
 - ▶ Conceptually, a tree with leaves as base relations.

Figure: Join tree illustrations.

Query Optimization

- ▶ Cost-Based.
 - ▶ Large parameterized summation.
 - ▶ Sum over cost of each physical operator.

Figure: Join tree illustrations.

Query Optimization

- ▶ Join Algorithms are generally binary so the DBMS will generate intermediate relations.
- ▶ **Cardinality Estimation:** how large will these intermediate relations be?

Figure: Join tree illustrations.

Cardinality Estimation Error

- ▶ Systems rely on strong assumptions about the underlying data.

Cardinality Estimation Error

- ▶ Systems rely on strong assumptions about the underlying data.
- ▶ Assume independence of attribute value distributions across columns.

Cardinality Estimation Error

- ▶ Systems rely on strong assumptions about the underlying data.
- ▶ Assume independence of attribute value distributions across columns.
- ▶ Leads to underestimation.
 - ▶ Real world data is correlated.
 - ▶ Underestimation is risky: leads to massive blow-up from poor join orderings/algorithm choice.

Review: Entropy

Take random variable X :

$$h(X) = - \sum_a \mathbb{P}(X = a) \cdot \log(\mathbb{P}(X = a))$$

Multiple variables:

$$h(X, Y) = - \sum_{a,b} \mathbb{P}(X = a, Y = b) \cdot \log(\mathbb{P}(X = a, Y = b))$$

Conditional Entropy:

$$h(X|Y) = - \sum_{a,b} \mathbb{P}(X = a, Y = b) \cdot \log\left(\frac{\mathbb{P}(X = a, Y = b)}{\mathbb{P}(Y = b)}\right)$$

Review: Entropy

Let X be uniformly distributed on the space $\{a_1, a_2, \dots, a_n\}$.

$$\begin{aligned} h(X) &= - \sum_{i=1}^n \mathbb{P}(X = a_i) \cdot \log(\mathbb{P}(X = a_i)) \\ &= - \sum_{i=1}^n \frac{1}{n} \cdot \log\left(\frac{1}{n}\right) \\ &= -n \frac{1}{n} \cdot \log\left(\frac{1}{n}\right) \\ &= \log(n) \end{aligned}$$

Connection to Entropy

$Q(x, y, z, w) :- aka(x, y), cast(y, z), movie_companies(z, w), company_name(w)$

Connection to Entropy

$Q(x, y, z, w) :- aka(x, y), cast(y, z), movie_companies(z, w), company_name(w)$

- Create a random variable for each of the attributes present in the query.

$$x \rightarrow X, \quad y \rightarrow Y, \quad z \rightarrow Z, \quad w \rightarrow W$$

Connection to Entropy

$Q(x, y, z, w) :- aka(x, y), cast(y, z), movie_companies(z, w), company_name(w)$

- ▶ Create a random variable for each of the attributes present in the query.

$$x \rightarrow X, \quad y \rightarrow Y, \quad z \rightarrow Z, \quad w \rightarrow W$$

- ▶ Let (X, Y, Z, W) be uniformly distributed over all tuples in the true output of Q .

$$|Q(x, y, z, w)| = \exp(h(X, Y, Z, W))$$

Entropic Bounds

$$|Q(x, y, z, w)| = \exp(h(X, Y, Z, W))$$

- Suffices to bound $h(X, Y, Z, W)$.

Entropic Bounds

$$|Q(x, y, z, w)| = \exp(h(X, Y, Z, W))$$

- ▶ Suffices to bound $h(X, Y, Z, W)$.
- ▶ There are plenty of entropic bounds to choose from!

Entropic Bounds

$$h(X, Y, Z, W) \leq \dots$$

- 1 $h(X, Y) + h(Z|Y) + h(W|Z)$
 - 2 $h(X, Y) + h(Z|Y) + h(W)$
 - 3 $h(X, Y) + h(Z, W)$
 - 4 $h(X, Y) + h(Z|W) + h(W)$
 - 5 $h(X|Y) + h(Y, Z) + h(W|Z)$
 - 6 $h(X|Y) + h(Y, Z) + h(W)$
 - 7 $h(X|Y) + h(Y|Z) + h(Z, W)$
 - 8 $h(X|Y) + h(Y|Z) + h(Z|W) + h(Z)$
-

(only a subset of all entropic bounding formulas)

Entropic Bounds

$$h(X, Y, Z, W) \leq \dots$$

- 1 $h(X, Y) + h(Z|Y) + h(W|Z)$
 - 2 $h(X, Y) + h(Z|Y) + h(W)$
 - 3 $h(X, Y) + h(Z, W)$
 - 4 $h(X, Y) + h(Z|W) + h(W)$
 - 5 $h(X|Y) + h(Y, Z) + h(W|Z)$
 - 6 $h(X|Y) + h(Y, Z) + h(W)$
 - 7 $h(X|Y) + h(Y|Z) + h(Z, W)$
 - 8 $h(X|Y) + h(Y|Z) + h(Z|W) + h(Z)$
-

(only a subset of all entropic bounding formulas)

Entropic Bounds

$$|Q(x, y, z, w)| = \exp(h(X, Y, Z, W)) \leq \exp(h(X|Y) + h(Y, Z) + h(W|Z))$$

$$h(X|Y) \leq \log d_{\text{aka}}^y$$

$$h(Y, Z) \leq \log c_{\text{cast}}$$

$$h(W|Z) \leq \log d_{\text{movie_companies}}^z$$

$$d_{\text{aka}}^y = \text{“Max Degree”}$$

= Count of most common y attribute value in aka_name.

$$c_{\text{cast}} = \text{“Count”}$$

= Count of entire cast_info relation.

Cardinality Bound

$$\begin{aligned}
 |Q(x, y, z, w)| &= \exp(h(X, Y, Z, W)) \\
 &\leq \exp(\underbrace{h(X|Y)}_{\leq \log d_{\text{aka}}^y} + \underbrace{h(Y, Z)}_{\leq \log c_{\text{cast}}} + \underbrace{h(W|Z)}_{\leq \log d_{\text{movie_companies}}^z}) \\
 &\leq d_{\text{aka}}^y \cdot c_{\text{cast}} \cdot d_{\text{movie_companies}}^z
 \end{aligned}$$

- ▶ Number of elements to sum up exponential in hash size.
 - ▶ Exponent is number of attributes in entire query.
- ▶ Non-monotonic bound behavior

Tuning Bucket Allocation

- ▶ As the number of buckets increases, we get more information, and bounds tighten, right?

Tuning Bucket Allocation

- ▶ As the number of buckets increases, we get more information, and bounds tighten, right?
- ▶ When exclusively partitioning unconditionally covered attributes: yes.

Tuning Bucket Allocation

- ▶ As the number of buckets increases, we get more information, and bounds tighten, right?
- ▶ When exclusively partitioning unconditionally covered attributes: yes.
- ▶ When also partitioning conditionally covered attributes: not necessarily.

Tuning Bucket Allocation

- ▶ As the number of buckets increases, we get more information, and bounds tighten, right?
- ▶ When exclusively partitioning unconditionally covered attributes: yes.
- ▶ When also partitioning conditionally covered attributes: not necessarily.
 - ▶ Non-monotonic tradeoff space.

Example of Non-monotonic Behavior

$$Q(x, y, z) :- R(z, y), S(y, z), T(z, w)$$

x	y		y	z		z	w		x	y	z	w
0	0		0	0		0	0		0	0	0	0
0	1	\bowtie	1	0	\bowtie	1	1	$=$	0	1	0	0
1	0		2	1		2	2		1	0	0	0
1	1		3	1		3	3		1	1	0	0
R			S			T			Q			

Example of Non-monotonic Behavior

x	y		y	z		z	w		x	y	z	w
0	0		0	0		0	0		0	0	0	0
0	1	⋈	1	0	⋈	1	1	=	0	1	0	0
1	0		2	1		2	2		1	0	0	0
1	1		3	1		3	3		1	1	0	0
R			S			T			Q			

Example of Non-monotonic Behavior

x	y		y	z		z	w		x	y	z	w
0	0		0	0		0	0		0	0	0	0
0	1	⋈	1	0	⋈	1	1	=	0	1	0	0
1	0		2	1		2	2		1	0	0	0
1	1		3	1		3	3		1	1	0	0
R			S			T			Q			

$$|Q(x, y, z)| \leq \min \begin{cases} c_R \cdot d_S^y \cdot d_T^z \\ d_R^y \cdot c_S \cdot d_T^z \\ d_R^y \cdot d_S^z \cdot c_T \\ c_R \cdot c_T \end{cases}$$

Example of Non-monotonic Behavior

x	y		y	z		z	w		x	y	z	w
0	0		0	0		0	0		0	0	0	0
0	1	⋈	1	0	⋈	1	1	=	0	1	0	0
1	0		2	1		2	2		1	0	0	0
1	1		3	1		3	3		1	1	0	0
R			S			T			Q			

$$|Q(x, y, z)| \leq \min \begin{cases} c_R \cdot d_S^y \cdot d_T^z \\ d_R^y \cdot c_S \cdot d_T^z \\ d_R^y \cdot d_S^z \cdot c_T \\ c_R \cdot c_T \end{cases}$$

$$c_{R(0)} \cdot d_{S(0,0)}^y \cdot d_{T(0)}^z = 4 \cdot 1 \cdot 1 = 4$$

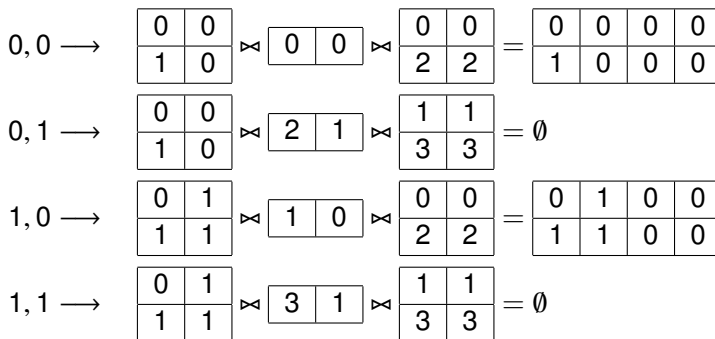

- ▶ Define hash function $\text{hash}(u_i) = i \% 2$.

$$\text{hash}(0) = \text{hash}(2) = 0$$

$$\text{hash}(1) = \text{hash}(3) = 1$$

Table Scans During Optimization

Analysis of selection predicates can lead to:

Table Scans During Optimization

Analysis of selection predicates can lead to:

- ▶ Full propagation.
 - ▶ Highly selective predicate: yields fewer tuples than the hash size.
 - ▶ Scans on predicate relation and (most likely) on foreign key relation.

Table Scans During Optimization

Analysis of selection predicates can lead to:

- ▶ Full propagation.
 - ▶ Highly selective predicate: yields fewer tuples than the hash size.
 - ▶ Scans on predicate relation and (most likely) on foreign key relation.
- ▶ Updated the bound sketch.
 - ▶ Selective predicate but more tuples than hash size.
 - ▶ Scan on predicate relation.

Table Scans During Optimization

Analysis of selection predicates can lead to:

- ▶ Full propagation.
 - ▶ Highly selective predicate: yields fewer tuples than the hash size.
 - ▶ Scans on predicate relation and (most likely) on foreign key relation.
- ▶ Updated the bound sketch.
 - ▶ Selective predicate but more tuples than hash size.
 - ▶ Scan on predicate relation.
- ▶ Defaulting to unmodified bound sketch.
 - ▶ Non selective predicate.
 - ▶ Early exit during scan on predicate relation.
